## CROP AND WEATHER SERVICE MARKS CENTENNIAL

Since 1872 the Nation has benefitted from a Century of service of thousands of weather observers, county agents and crop reporters. These dedicated people have provided reliable, current information on weather and its effect on our food and fiber supply.

The weather-crop service, since 1940, has been a cooperative effort of the U.S. Departments of Agriculture and Commerce. Today weather and crop condition summaries appear in the national Weekly Weather and Crop Bulletin. The Nebraska Weekly Weather and Crop Report provides more detail on conditions within the State.

in Nebraska, county agents with the Nebraska Agricultural Extension Service provide the weekly data on crop development, while weather observers, mostly volunteers, with the National Weather Service provide weather data.

Release 6/12/72

Week Ending 6/12/72

WEATHER Another very warm week was noted in Nebraska although it turned cool over the week end. Weekly temperatures averaged from six to eight degrees above normal. Precipitation consisted of scattered showers that were very light in most sites, but there were isolated cases where heavy showers left an inch or more of moisture.

Delayed reports showed that the "local" showers west of the Imperial-Valentine line that were mentioned in last week's report turned out to be rather general in that area.

CROPS Warmer temperatures accelerated evaporation of top soil moisture. Fields have become dry once again. Reports from some areas indicate a good shower would be welcome, especially for late planted fields. With some exceptions in the Panhandle, farmers were able to work in fields almost every day.

Corn planting is virtually complete across the State. Most plantings have emerged to good stands, and plants are making rapid development. Cultivation and rotary hoe operations are under way. A few local insect problems have been noted but are not serious at this time.

- Sorghum planting is about 92 percent completed, which is near normal. The warm soil temperatures are aiding sprouting and emergence of plants. Greenbug populations are building up and pose a threat to fields in southeastern Nebraska. Some farmers have sprayed fields for control. Other fields will require spraying to prevent economic losses.

Soybean plantings are about 88 percent complete, which is also near normal. Condition of the planted crop is mostly good to excellent.

The sugar beet crop is making very good growth as a result of warm temperatures and generous rainfall. Growers were quite busy with thinning and weeding operations. Dry bean growers have started planting and have generally good seed bed conditions as a result of recently received precipitation. Locally severe hall and heavy rain in the Panhandle caused some replanting of crops. Weather conditions were favorable for cutting alfalfa during the week. Pasture and range feed conditions are average to above average in most areas of the State.

LIVESTOCK Hot, humid conditions on several days this past week caused discomfort to live-stock. Tiles are becoming a problem where uncontrolled.
